Abstract--This paper investigates operational techniques to achieve seamless (smooth) microgrid (MG) transitions by dispatching a grid-forming (GFM) inverter. In traditional approaches, the ...

MGs can operate in two main modes: grid-connected or islanded. The main network does not dominate the dynamics of the island mode, and this mode is more challenging than ...

Abstract--This paper develops an integrated synchronization control technique for a grid-forming inverter operating within a microgrid that can improve the microgrid's transients during ...

To improve the anti-interference ability of DC microgrid bus voltage, a grid-connected inverter control strategy based on improved virtual control is proposed.

As power conditioning capability is vital for a microgrid (MG) system, a new MG frame with hybrid parallel-connected ICIs and CCIs was proposed in this paper. With lower DC ...

However, because renewable energy is connected to the power grid by power electronic equipment, it does not have mechanical inertia and damping characteristics.

Abstract--This paper investigates microgrid transient stability with mixed generation--synchronous generator (SG), grid-forming (GFM) and grid-following (GFL) ...

This paper proposes a control strategy for grid-following inverter control and grid-forming inverter control developed for a Solar Photovoltaic (PV)-battery-integrated microgrid ...

To address these challenges, many studies focus on grid-side inverters, which can be controlled using two main strategies: Grid Following (GFL) and Grid Forming (GFM). ...

This paper first addresses the challenges of networking microgrids with grid-forming inverter in droop control. Then, it proposes a pre-synchronization algorithm to improves the ...

As power conditioning capability is vital for a microgrid (MG) system, a new MG frame with hybrid parallel-connected ICIs and CCIs ...
