How many cells are in a Ni Cd battery?

Ni-Cd batteries used to replace 9 V batteries usually only have six cells, for a terminal voltage of 7.2 volts. While most pocket radios will operate satisfactorily at this voltage, some manufacturers such as Varta made 8.4 volt batteries with seven cells for more critical applications.

How do you dispose of a Ni-Cd battery?

environment. The metals content in a Ni-CD battery are toxic for the environment. If not recycled, it must be disposed of with all state and local regulations. Disposal considerations: Incineration, Not at Ni-Cd batteries. Landfill. Never dispose of Ni-Cd batteries as landfill. Recycling: Nickel Cadmium batteries can be

How much does a Ni-Cd battery self-discharge?

When not under load or charge, a Ni-Cd battery will self-discharge approximately 10% per month at 20°C, ranging up to 20% per month at higher temperatures. It is possible to perform a trickle charge at current levels just high enough to offset this discharge rate; to keep a battery fully charged.

What is a good charging voltage for a Ni-Cd battery?

For a charging voltage higher than 1.45V/cell, the current is limited @0.1C5. It is the voltage per cell at which the discharge is finished. For Ni-Cd, it is recommended to select a low EOD voltage (e.g. 1.00 V per cell), irrespective of the discharge time. The number of cells is linked to the voltage window of the load.

In order to maximize battery safety, please consult Panasonic when determining charge / discharge specs, warning label contents and unit design. Note: [It] was previously expressed ...

NiCd Packs All Yuasa cylindrical cells can be connected together to form higher voltage packs. Depending upon quantities required almost any configuration can be achieved.

It shall be housed in polypropylene containers. It is acceptable to have containers (including several cells in series) in order to optimize the installation cost.

Dispose of contents/container to an appropriate recycling or disposal facility. During operation and especially during charging, hydrogen gas and harmful alkali mist may be produced.
